criticism which is not already recorded in the book. For example, the indiscriminate use of the term 'glomerulonephritis' is just as harshly criticized by the members of the symposium as it could be in a review.

In the general discussion at the end of the book there is much information on the indications for and risks of renal biopsy. Throughout, the expression of different points of view by physicians and pathologists lends a balance which is of great value. There is a satisfactory index and numerous references within the text.

This is a most useful book for those who wish to know more about the structure and function of the kidney, including pathologists who are faced with the difficult task of interpreting the histological appearances of a renal biopsy.
