Treatment with Kabikinase within hours of the onset of serious occlusion usually prevents irreversible tissue necrosis and may often be limb-saving. Kabikinase therapy should be commenced as soon as possible using the simplified standard dosage scheme.* No elaborate assays are necessary, but as thrombotic damage usually proceeds rapidly after occlusion it is advisable to hold in the Pharmacy standby stock for at least one patient treatment. Otherwise delivery is arranged by the swiftest transport available at the time from Kabi Pharmaceuticals Ltd. Telephone 01-567 4717.
