Letters to the Editor

Bacillus cereus infections

The importance of Bacillus organisms, particularly B. cereus, in local infections has been largely overlooked because they are commonly encountered as contaminants in specimens or cultures. Turnbull et al. (J Clin Pathol 1979;32:289-93) reported severe infections with B. cereus and prompted me to review the recent isolates in this laboratory.

In the nine months, November 1978 to July 1979, there have been nine significant isolates of Bacillus. Details of these infections are given in the Table. Infected traumatic or surgical wounds of the limbs account for nearly half these cases, but clinical severity is very variable. It is my experience that moderate or heavy growths of Bacillus from wounds are usually of clinical significance.

M BARNHAM

Harrogate General Hospital,
Knaresborough Road,
Harrogate HG2 7ND

In view of recent publications on B. cereus and its pathogenicity in serious wound infections due to necrotising toxins,1-4 I should like to report the following four cases which we have seen during the past four months. (Table opposite)

In three of these four cases the strain of B. cereus isolated was a strong producer of toxin, and certainly in case 3 was the only pathogen isolated, and it is likely that this organism played a significant role in these infections.

In case 4 the wound swab was taken five days after starting ampicillin, to which B. cereus was resistant, and the pyrexia settled after a further two days of treatment. Since this strain was shown to be a weak product of toxin it is unlikely to have played a major pathogenic role in this patient.

It is most important to consider B. cereus as a potential pathogen in wound sepsis, and toxin testing may be useful to assess its significance in individual cases.

I am grateful to Dr Peter Turnbull, of the Food Hygiene Laboratory, Central Public Health Laboratory, Colindale, for serotyping and toxin testing these strains.

DIANA WHITE
Public Health Laboratory,
Bath

References

The letters from Drs Barnham and White are important in supporting and emphasizing the existence of a problem of Bacillus organisms in local infections. Accordingly, we wish to draw to the attention of readers our interest in the immunological responses to such infections, particularly those involving B. cereus and B. anthracis, which relate to the toxic products of these organisms.

In addition to the non- anthrax Bacillus cultures, which should continue to be sent to the Food Hygiene Laboratory, we should like to obtain serum from patients in whom there is good evidence of infection with Bacillus organisms as primary pathogens. Such serum samples should be sent to the Vaccine Research Laboratory, CAMR, Porton Down, Salisbury, Wilts.

**Book reviews**

This book is the proceedings of the third symposium on 'Onco genesis and Herpes viruses'—in this instance held in Cambridge, Massachusetts in 1977. It is not a book for most clinical pathologists, being a collection of papers on the molecular biology of herpes viruses. However, for the specialist researcher worker in the field, it is invaluable and contains some of the exciting developments that have taken place in recent years. These are largely due to the introduction of techniques such as restriction enzyme analysis, and the results of its application to herpes DNA are to be found throughout the contents. Thus these are papers describing the mapping of genes coding for virus-specific polypeptides on the viral genome and the characterisation of virus DNA from transformed cells. The scope of the papers is of courses wider than this, and there are sections which deal with virus antigens and virus macro-molecular synthesis in permissive and non-permissive cells. The bulk of the papers are on herpes simplex virus, but there are sizable contributions on Epstein-Barr virus, cytomegalovirus, and a few of the animal herpes viruses. The only criticism I have is that some of the papers have been overtaken by publications in scientific journals, and the book would have been of greater value if it had been possible to publish it in one year rather than two years after the symposium took place. 

**MORAG C TIMBURY**

The second part of the symposium will be of greater interest to medical readers since it is on host-virus interactions, both in vitro and in vivo. Epstein-Barr virus dominates the papers, although other human herpes viruses, as well as those of various animal species, are included. Possibly the most interesting contributions to a clinical pathologist are those which deal with latency and with the immune response to Epstein-Barr virus infection. Both these fields are 'growth points' at present, and this book contains much new and interesting data on them. Although not a book for the general reader, it will be indispensable for workers in the field, which includes not only virologists, but the larger number of workers involved in the investigation of the role of viruses in cancer.

**MORAG C TIMBURY**

This slim volume is the product of a symposium on paediatric nephrology, held in San Juan, Puerto Rico, in May 1976 under the guidance of Dr JF Pascual of Georgetown University, Washington DC, USA. It consists of reviews articles by well-established figures in paediatric nephrology (Edelman, McCrory, Arneil, Gruskin, Pascual, Calcagno) on pathological topics related to the newborn.

This is an example of secondary literature in that most of the authors have presented their material in a more definitive form elsewhere. The volume will be of little interest to those who are conversant with the field, and of little value to those who are not. The sterling price is not quoted but must be at least £10. At 15p per page the temptation to illegal use of the Xerox will be strong.

**TM BARRATT**

These two volumes are the proceedings of a conference on shock held in Airlie, Virginia in June 1978. The papers in Volume 1 range over a variety of aspects concerned with hypovolaemic (oligaemic), cardiogenic, and splanchic shock, and related aspects of hypoxia and ischaemia. Its introductory chapter is by Richard Lillehei, who gives an interesting historical analysis of induced vasodilatation for
