Histomorphometry and immunohistochemistry of beef sausages

On reading the letter by Dr Boon concerning histological studies of beef sausages, it occurs to me that, in view of the culinary nature of the specimens, microtome fixation might afford optimal results. Perhaps he should consider a collaborative study with his namesake, Dr ME Boon, an authority on this technique.

Use of Tipp-Ex for surgical resection margins

We would like to draw attention to the recent letter in which 'Tipp-Ex fluid was recommended as a convenient marker for surgical resection margins. Dr Harris has been “economical with the truth” in stating that processing equipment is “unaffected” by Tipp-Ex fluid. We have found that Tipp-Ex fluid rapidly blunts microtome knives. In the interests of economy and laboratory harmony we would like to set the matter straight.

BOOK REVIEWS

This is a most unusual book, the stated aim of which is to allow pathologists to test their skills at interpreting ultrastructural appearances. Thirty cases are set out individually with a brief clinical history and, initially, a single "diagnostic" electron photomicrograph. A set of questions are posed and then the authors go through the light microscopic and ultrastructural features of the lesion in question, providing further illustrations (all in black and white) to back up their diagnoses. The 30 cases presented comprise 24 tumours, three forms of glomerulonephritis, two storage diseases, and one case which covers two different viral infections. This is probably a fair reflection of the distribution of diagnostic electron microscopy in most laboratories. Of the tumours, however, there is rather undue bias on neuroendocrine neoplasms (which are pretty repetitive ultrastructurally) and on sarcomas. The quality of pictures throughout is perfectly acceptable, although not stunning. The explanatory descriptions and clinicopathological discussion of each case are of good quality, if a little unimaginative. In more than half the cases the authors admit that the diagnosis could have been readily reached without resorting to electron microscopy which rather detracts from their claims about the value of this technique. Given the inevitably idiosyncratic choice of cases at its book of this type, it is hard to imagine the type of individual who might purchase it. Nevertheless, candidaces frequented of being shown electron microscopy in the final MRCPath might find this book a useful informal text to flip through at the last minute.

This is a timely, inexpensive, and highly readable paperback that is potentially of value to workers in all pathology subspecialties. In the first chapter the authors give a simple outline of nucleic acid chemistry and cell biology and the second chapter is devoted to the general principles of practical procedures including Southern blot and in-situ hybridisation. In the first chapter the authors give a simple outline of nucleic acid chemistry and cell biology and the second chapter is devoted to the general principles of practical procedures including Southern blot and in-situ hybridisation. The polymerase chain reaction. Naturally, given its length, this is not a bench book but, as the pun in the title suggests, a gentle and well illustrated introduction. The brief section on restriction fragment length polymorphism analysis would be easily understood by undergraduates. The third chapter considers diagnostic applications with emphasis on leukaemia, lymphomas, and genetic disease. This reviewer now knows a lot more about T cell gene rearrangements, and reading about them was a pleasure.

At the end of the book there is a very useful glossary of technical terms and quite extensive bibliography comprised predominantly of 1987 and 1988 references. I highly recommend this book.

M WELLS

Ehrlichiae are small pleomorphic obligate intracellular micro-organisms belonging to the family Rickettsiaceae and can cause infections in both humans and animals, notably dogs. The book is based on a symposium in Washington: DC in 1988 but has been updated to include more recent data from experts on Ehrlichia and related pathogens. The first of 13 chapters is an account of the historical background and global importance of ehrlichiosis and is followed by chapters on their cultivation, structure, biological properties, and pathology. Chapter nine describes human ehrlichiosis in the USA after which there are discussions on the evolutionary history of chlamydiae, research on cowdriosis (heartwater disease in cattle), and current strategies in research on ehrlichiosis. The last chapter is an epilogue which provides a useful summing up of the contents of this undoubtedly comprehensive and authoritative account of the subject.

Nevertheless, I doubt whether this book will be useful to pathologists in hospitals in northern Europe, but it may interest our veterinary colleagues and those in warmer climates.

NOTICES

Mediastinal tumours—Pandora's Box

National Heart & Lung Institute
In association with Royal Brompton & National Heart Hospital, London
3–4 December, 1990

A two day symposium designed for radiologists, respiratory physicians, surgeons, oncologists and pathologists, but should be of interest to others involved in the field of thoracic medicine. Topics will include thymomas, lymphomas, germ cell, neural endocrine and rarer connective tissue tumours. An emphasis will be made on imaging and therapy.

Further details are available from: Postgraduate Education Centre National Heart & Lung Institute Dovehouse Street, London SW3 6LY Direct telephone: 071-351 8172 (24 hrs) Facsimile: 071-376 3442

J Clin Pathol: first published as 10:1136/jcp.43.10.879-a on 1 October 1990.
