Paper chromatography are well covered but chemiluminescence and flow injection analysis, for example, are omitted. It would also be possible to read this book without realising the impact of microprocessors on laboratories. A chapter is badly needed on computers and peripherals to cover such topics as the principles of the microprocessor, interfaces, IEEE standards, and so on. As a basic introduction for laboratory staff this book is highly recommended despite its limitations. Whether it is affordable by junior staff is another matter.

J M RATTENBURY

The WHO Technical Report Series makes available the findings of various international groups of experts on a broad range of topics. This report reviews the present state of synthetic antigens in the serological diagnosis of infectious disease and assesses their relative advantages and limitations compared with natural epitopes. It begins with an account of progress in peptide synthesis and recombinant DNA technology for production of antigens and procedures for identification of antigenic determinants. There follows reports on T cell diagnostic assays, the potential of synthetic reagents in the diagnosis of a variety of virus infections, and of research to improve the diagnosis and monitoring of progress in HIV infections and some bacterial and parasitic diseases. It ends with a few general conclusions and recommendations.

This easily read report is full of facts and relevant observations which will be of most use to researchers in assessing current progress, as a source of ideas, and as an indicator of the direction of future work, but many microbiologists will find it fascinating.

RN PEEL

Published in a series entitled Cancer Treatment and Research this book presents 18 chapters on a variety of aspects of lung cancer by an international cast from 12 countries. It is a tribute to the skills of the editor that despite the varying background of the contributors the book is well written and easy to follow. Much of the content is related to treatment and therefore presumably aimed primarily at clinicians, but there are three chapters on pathology and others on the pathobiology of lung tumours which may well be of interest to pathologists.

Mackay (Texas) describes results from techniques such as cytopathology, immunocytochemistry, and electron microscopy, and the implications of the results for the classification of lung tumours. A group from Hong Kong have studied observer variability in the application of the WHO classification and highlight the problems of comparisons of incidence and treatment among different centres. A Japanese group describe a range of immunological methods but admit that although these are useful for both routine diagnosis and study of tumour biology they have not yet achieved their aims of distinguishing tumour cell type from those of low metastatic potential, and finding markers for responsiveness to treatment. There is also a chapter on oncogenes which includes useful references for those whose basic medical and pathology education occurred in the pre-oncogene era.

A book which aims to relate the current knowledge of the pathobiology of tumours and the current understanding of treatment techniques is obviously laudable. It is clear that this text will be too specialised and clinically orientated for the general histopathologist, but it would be useful for those with a special interest in lung pathology and particularly for clinical oncologists in this field.

TH FLEWITT

This atlas is a reprint of the highly successful original published in 1980 due, presumably, to continuing demand but it has not been revised nor updated. The text is brief but it is adequate and clear, with useful tables. The references date from the 1960s and 1970s. However, the chapter on "Immunofluorescence diagnosis—current status" remains what it was 10 years ago. The main attraction of the book is the large number of colour illustrations which depict the organisms themselves and their histopathological setting. These are all of high quality and, as our knowledge of the morphology of fungi has not changed much, they still serve as a useful library of images to refer to. It is a pity, nevertheless, that a second edition of this beautifully produced book has not appeared and the reader in search of recent information on epidemiology, disease patterns, and other aspects such as AIDS has to turn to other works.

PP ANTHONY

The preface to this text and atlas asserts that, "dermatologists are performing skin biopsies in increasing numbers in quest of an accurate tissue diagnosis as the basis for effective management of skin disease. Unfortunately they do not always get the diagnostic pathology service which they deserve." The authors set out to remedy the problem with an illustrated account of the commoner skin conditions which turn up as biopsy specimens.

In this task they have triumphed. The photographs are in colour, well printed, of very good quality, and are well laid out. The selection of conditions illustrated is reasonably comprehensive and largely represents cases seen in the authors' routine practice. For a pathologist the most useful feature is the inclusion of good clinical photographs to complement the histopathology, so that some appreciation of the clinical appearance of lesions can be gained.

The book can be recommended to any pathologist or dermatologist who is starting on the road towards an acceptable level of dermatopathological literacy. Problems of differential diagnosis will have to be solved elsewhere but as an introduction to or refresher of the subject, it represents good value.

N KIRKHAM

This monograph is the latest of the Perspectives in Pediatric Pathology series and covers pathological and related clinical aspects of
