that the three grade system should be abandoned in favour of a simplified version.⁴ For the working party to ignore this objective evidence and to propose complicating further the CIN system with an additional "borderline" group we regard as astonishing! The diagnosis of CIN I in the presence or absence of viral changes or inflammation was correctly made by both the Scottish and the Welsh groups only slightly more often than would have occurred by chance. Therefore, the addition of an extra low grade category "basal abnormalities of uncertain significance"¹ can only increase this confusion. The present working party has not suggested any new diagnostic criteria nor has it suggested any additional techniques which might be used to clarify this diagnostic difficulty. At the moment there is no way in which to determine the "correct" answer in any individual case. We would be very interested to know whether the members of this expert group are carrying out an objective study, similar to the ones done previously, of the "robustness" of their new classification.

BOOK REVIEWS

Glomerular Pathology. W Lawler. (Pp 208; £60.) Churchill Livingstone. 1991. ISBN 0-443-04062-1.

This monograph consists of a series of short chapters with concise text and numerous illustrations covering the various types of glomerular changes encountered in renal biopsy material. Instead of detailed references there are lists of additional reading material at the end of each chapter. In the preface we are told that this book is aimed at the junior histopathologist and, certainly, the text would seem appropriate at this level of experience and training. My only real quarrel with the text is that in chapter 11 the author fails to explain the difference between those types of focal proliferative glomerulonephritis which have developed on a background of diffuse mesangial disease as in IgA disease, lupus, etc.) and those which have not (microscopic polyarteritis and Wegener's etc).

In the individual chapters the author places the "clinical features" section at the end

which I consider inappropriate because the whole approach to diagnosis should be based on the clinical setting in which the renal biopsy specimen has been obtained. My particular concern is that the clinical data should not be regarded as unimportant which is the most likely conclusion if it is placed at the end of a chapter. So often nephrologists do not appreciate how valuable clinical data can be to the renal pathologist faced with a difficult biopsy specimen.

The final point about this book is that the illustrations of light microscopy are generally poor with a rather "foggy" appearance. They lack the sharpness, which is essential for demonstrating the finer aspects of glomerular changes. In some cases the staining technique appears less than ideal but, regardless of this problem, the photographic technique appears to be quite poor. In contrast the electron micrographs are of good quality.

DR TURNER

Cytokines. MJ Clemens. **The Medical Perspectives Series.** (Pp 122; paperback. £11.95.) BIOS Scientific Publishers. 1991. ISBN 1-872-74870-8.

This book offers a straightforward introduction to cytokines, covering a wide range of topics such as cytokine structure and function, signal transduction, oncogenes, cytokine gene expression, the biological roles of cytokines in both health and disease, finishing with a chapter on cytokines as potential therapeutic agents.

The chapter on signal transduction is especially good, providing a simplified yet detailed description of a complicated subject, as is the coverage of oncogenes. Throughout the whole book the authors include tables of basic yet useful scientific properties such as molecular weights, exon numbers, chromosome location of genes, affinity constants as well as biological data such as cytokine networks, and principle producing cells under a wide variety of stimuli. This combination of basics with detail makes this an excellent book for researchers and students new to the cytokine field, as well as established researchers who may need specific details or who would like to broaden their knowledge, to related areas. On the negative side we feel that the authors overuse the Interferons in examples, and could have sometimes used the Interleukins as an alternative.

Overall, this volume is excellent and successfully approaches an extremely diverse and complicated field in a straightforward manner.

CA MCINTYRE
RC REES

Biopsy Pathology of Muscle. 2nd ed. M Swash, MS Schwartz. **Biopsy Pathology Series 15.** (Pp 237; £50.) 1991. ISBN 0-412-34880-2.

This is the second edition of this volume on muscle biopsy pathology. As with other books in the series this is a bench book, intended for the use of the diagnostic histopathologist who receives muscle biopsy specimens, and for trainees in neuropathology and histopathology.

The book has 11 chapters, and starts with the structure of normal muscle and the indications for performing a muscle biopsy.

A methods and techniques section follows in which the biopsy procedure is described with a detailed account of the treatment of the specimen in the laboratory. The characteristics of normal muscle, including morphometric features, are followed by the histological appearances of disordered muscle under the headings: inflammatory myopathies; muscular dystrophies; "benign" myopathies of childhood; metabolic, endocrine and drug induced myopathies; and neurogenic disorders. For the sake of completion there is a chapter on tumours. The book is well illustrated throughout with light and electron micrographs.

The publication is timely as there are few books to guide the practising histopathologist in the interpretation of muscle biopsy specimens. It is up-to-date and practical, and is likely to serve most of the needs of the readership for whom it is intended.

M HONAVAR

Thymus Update. 4 The Thymus in Immunotoxicology. Ed MD Kendall, MA Ritter. (Pp 360; no price given.) Harwood Academic Publishers. 1991. ISBN 3-7186-5113-0.

This book is fourth in a series on aspects of the thymus which has previously covered the thymic microenvironment, T lymphocyte differentiation, and its role in tolerance induction. All very sound and predictable, but this next volume sounds rather unpromising. Do not be put off by the title, however, immunotoxicology appears to include not just dioxins and organo-tin compounds, but acyclovir, cyclosporin, and FK506, even trauma and stress. We all know the effects of thymectomy, and how the thymus changes in size with disease and involutes with age. Most of us have heard of thymic education, apoptosis, and the programmed death of lymphocytes. Fewer are familiar with concepts of autoimmunity arising from the effects of thymus damage. And it is only the international cabal of thymus researchers who grapple with the finer detail of the effects of drugs on the cells and ultrastructure of the thymic microenvironment. Fascinating but esoteric stuff.

The preoccupations of this international community then fill what is essentially an upmarket hardback newsletter—what the crucial citations are, which PhD theses are worth reading, where to submit your thymus-related manuscripts, which were the good conferences and where they will meet next. More and more of us need thymic education, and the insight this book gives into the state of the art make it a useful library buy—but the other volumes will be needed too.

RS PEREIRA

Biopsy Interpretation of Lymph Nodes. Biopsy Interpretation Series. SH Swerdlow. (Pp 412; £110.00.) Raven Press. 1992. ISBN 0-88167-840-6.

This is the first book on the interpretation of lymph node biopsy specimens to give full recognition to the role of modern techniques, including immunohistochemistry and molecular biology, in making the correct diagnosis. The book is set out more or less in the traditional manner except that it begins with a

chapter covering the approach to lymph node diagnosis rather than the usual section on normal lymph node histology. Instead, this is covered in a slightly cumbersome chapter inappropriately entitled "Reactive lymph node hyperplasia" which describes everything that is not a neoplasm including such distinctly non-hyperplastic conditions as lymph node infarction and fatty infiltration. Thereafter, chapters on lymphomas, non-Hodgkin's and Hodgkin's, follow with a short final chapter on miscellaneous conditions.

The traditionalist need not fear that all has been sacrificed to science. There are abundant illustrations, mostly of a high standard, but a few are of poor quality and there is a curious tendency towards a small format, sometimes hardly larger than a postage stamp, which seems unnecessary. The four pages of colour plates bound into the centre of the book are mouthwateringly excellent—an oasis in a black and white desert! More colour (why not all colour?) in the next edition, please.

There is little to quibble with in terms of the content and much to praise. The author has struggled hard with the vexed question of classification of the non-Hodgkin's lymphomas and, courageously, for an American, has eschewed, the "working formation" in favour of the Lukes-Collins classification which European readers will be able to follow easily because of its conceptual similarity to the Kiel classification. Again, courageously, the author, while apologising for his heresy, buries the myth that Reed-Sternberg cells characterise nodular lymphocyte predominant Hodgkin's disease. Details of immuno-histochemical and molecular characteristics of the various lymphomas are described with appropriate attention to detail, and never unnecessarily smother information on the histology. A little more emphasis on paraffin wax section immunohistology and less on frozen sections might be more appropriate for a book of this kind, and it is a pity that the author has not yet joined the slowly growing band of pathologists who are able to demonstrate immunoglobulins in paraffin wax sections satisfactorily.

The style of this book is engagingly direct, even chatty, but sometimes it is over the top with jargon and more suitable to a journal article than a textbook. What would the proverbial Martian pathologist make of this section on page 189? "All ML, FCC are of B cell origin and will express pan-B cell antigens such as CD19 and CD20. Most SC and LC cases, many SNC cases, but only a minority of LNC cases (<20% of diffuse large cell lymphomas of B cell origin) will be CD10 positive (chapter 4, table 1) (16, 59, 69, 72, 76)." Fewer abbreviations would help.

This is a book by an expert for those who are themselves expert, or aspire to be expert haematopathologists. General pathologists, however, will benefit from including it in their personal library, if only as an aid to interpreting consultation reports and journal articles; the modest price of the book is distinctly in its favour given the amount of useful information that it contains. Dr Swerdlow, as the single author, is to be congratulated on this considerable achievement.

PG ISAACSON

Bronchoalveolar Lavage. Cytology and Clinical Applications. MW Stanley, MJ Henry-Stanley, C Iber. (Pp 240; £72.) Igaku-Shoin. 1991. ISBN 0-89640-189-8.

My overall impression of this book was that the authors had achieved what they set out to do and provided a comprehensive guide to the interpretation and clinical importance of the cytological changes in bronchoalveolar lavage (BAL). It is aimed at cytopathologists, cytotechnicians, and clinicians with an interest in pulmonary medicine. Although the authors admittedly do not cover the full range of morphological problems in cyto-diagnosis of BAL, I learnt an enormous amount about the potential value as well as the limitations of this technique. As with many diagnostic techniques, specimen collection, preparation and interpretation within the clinical context are essential for the results not to be over or under used.

One criticism is that the text is unnecessarily long, largely because of duplication of information. The authors excuse this on the basis of it being a multi-author text, and that duplication may be needed for certain sections to be read on their own. However, my opinion was that this had been overdone, and made it difficult retrospectively to find items of interest. Apart from the introduction, written by a clinician, the rest was written by a cytopathologist and cytotechnician working in the same department, alleviating any real need for duplication.

Differential cell counts in diffuse interstitial lung disease should only be interpreted with accurate information about the methods of specimen collection and the underlying diagnosis: the information in this book should encourage clinicians to resist the temptation to use BAL instead of a histological diagnosis, except in certain circumstances, including the diagnosis and exclusion of infections.

Not surprisingly, the most useful chapters were those devoted to areas where BAL is of the most use in practice. Pulmonary infections in the immunocompromised host are the most obvious example. Of equal value were the sections on metastatic carcinoma and lympho-reticular malignancies. In these clinical situations invasive biopsy is contra-indicated and BAL provides a better method of sampling the alveolar parenchyma than TBB or brushings.

The technical sections were well written and referenced and helped to make this a book which would be a useful addition to the library of any cytopathology department.

AMANDA HERBERT

Year Book of Pathology and Clinical Pathology. 1991. Ed KM Brinkhous, FG Dalldorf, RD Langdell, WW McLendon. (Pp 369; £42.) Wolfe Medical Publications Ltd. 1991. ISBN 0-8151-1246-7.

This is the 44th annual volume of the *Year Book of Pathology* series. It features the usual format of abstracts of general pathology, systemic pathology and clinical pathology, and a list of review articles. It is complemented by a section on quality control and laboratory management. As is usual in the series, the book makes interesting reading, although the subject matter is inevitably disparate which makes it uncertain how much can be learnt from the occasional casual perusal, which is probably all one can expect of most readers of the book. Nevertheless, perusal of my specialty interest confirms that the book does review important papers of interest and that much can be learnt from a look at specific specialty sections. I was disappointed to see a review of a paper on

Ki-67 assessment in colorectal cancer, this paper making no reference to a previous and similar study by yours truly published in well known pathology journal some 30 months previously!

This Year Book provided an opportunity to test the theory that North Americans tend to favour North American journals and articles. There is a preference for review of North American journals (73%; Ulrich's directory indicates that 41% of worldwide medical journals are American). However, only 67% of the total articles in the book are of North American origin. This would suggest that there has also been liberal review of non-American journals and articles to produce a reasonably well balanced representation of world pathology. The Year Book is not expensive; indeed the price has fallen by a couple of pounds since 1989. I think this is a useful reference source and I recommend it.

19th Annual Refresher Course

26-29 August 1992, Stockholm

The course should be of interest to radiologists, pathologists and clinicians. Brochures with further details can be obtained from Mary Catto, Pathology Department, Western Infirmary, Glasgow G11 6NT. Tel 041-339 8822 ext 4062 or Fax 041-337 2494.

Association of Clinical Pathologists

Junior Membership

Junior membership of the Association is available to medical practitioners who have been engaged in the practice of pathology for a period of less than four years. Junior members are able to remain in this category for a maximum of six years or on the attainment of consultant status. The annual subscription is £34 for those resident in the United Kingdom and £65 for those overseas. The annual subscription may be claimed against tax.

Junior members receive the *Journal of Clinical Pathology* each month. Other benefits are reduced registration fees to attend ACP scientific meetings, all the documents regularly sent to full members of the Association including *ACP News*, which has a regular column for juniors, and the twice yearly summary of pathology courses included in the ACP programme of postgraduate education. Junior members have their own representative body, the Junior Members' Group, which has a direct input to Council.

For Junior Membership apply to: The Honorary Secretary, Association of Clinical Pathologists, 221 Preston Road, Brighton BN1 6SA. (0273) 561188.

Lesley Fallowfield serves as a timely reminder which should be essential reading for clinicians. Algorithms are discussed, but we would question their usefulness. The way to learn to diagnose malignant melanomas is to see them and to be taught about them in a clinical setting.

E HIGGINS
A DU VIVIER

Systemic Pathology. 3rd ed. Vol 7. **Thymus, Lymph Nodes, Spleen and Lymphatics.** Ed K Henry, W St C Symmers. (Pp 1042; £140.) Churchill Livingstone. 1992. ISBN 0-443-03429-X

The new Symmers volume on haematopathology is a brave attempt to encompass all you need to know about the subject in a little short of 1000 pages. The stage is set with a short introductory essay on basic immunology and this is followed by what is essentially a comprehensive textbook on the thymus. Three chapters are devoted to the normal lymph node and non-neoplastic lymphadenopathies and are followed by a chapter on the spleen which, curiously, hardly addresses lymphoma. The following chapter of some 350 pages, while entitled "neoplastic disorders of lymphoreticular tissue," deals essentially with lymph node neoplasms with only the occasional mention of extranodal lymphomas. A section on immunohistochemistry rounds off the haematopathology, but is followed by a quite irrelevant chapter on lymphatics which surely belongs elsewhere.

There is much to be commended in this book. With few exceptions, including the extranodal lymphomas referred to above, its coverage is encyclopaedic, it is comprehensively illustrated, and the index is unusually good. It is appropriately easy to use and, consequently, will be a useful bench book. The chapter on the thymus is especially valuable because there is no other comparable text on this subject. It is a pity, however, that the Müller-Hermelink classification of thymomas, although praised, is not used.

However, this book cannot be recommended to those seeking enlightenment about this difficult and sometimes controversial branch of pathology. The two short chapters at the beginning and end of the book, on basic immunology and immunohistochemistry, respectively, comprise the only gestures to "science". Molecular genetics, which has contributed so much to recent advances in our understanding of haematopathology, does not feature at all. It is, surely, inexcusable not to have mentioned immunoglobulin light chain restriction, CD10 positivity, immunoglobulin gene rearrangement and the t(14;18) translocation in the 25 pages and 42 illustrations devoted to follicular lymphoma. Pathologists are now much less exercised about the classification of non-Hodgkin's lymphomas than this book would suggest, having settled for either the working formulation or the updated Kiel classification. Developments in immunophenotyping and molecular genetics are beginning to stimulate new thoughts about lymphoma classification, but in this respect the book moves decisively backwards to the largely abandoned classification of the British National Lymphoma Investigation.

The publishers of this series have, for some reason, chosen to persist with the same dull

format as that of the first (1966) edition. The illustrations are also rather flat and grey. The aim seems to be to present British pathology as a dignified, conservative descriptive discipline; this accentuates the faults of this book and masks its strengths. The authors deserve better.

P G ISAACSON

Biopsy Pathology of the Skin. N Kirkham. **Biopsy Pathology Series 16.** (Pp 396; £59.50.) Chapman & Hall. 1991. ISBN 0 412 35080 7

I must admit to being a little sceptical when this compact volume of just under 400 pages arrived on my desk. This scepticism arose from my doubt that a book purporting to cover biopsy pathology of the skin could be easily carried in my overcoat pocket.

I had a pleasant surprise. Not only did I find this book easy to read (probably due to Dr Kirkham's rather anecdotal and idiosyncratic style) but also when put to the acid test of lying next to my microscope for a few weeks I found myself referring to it rather more often than some of the larger texts on my shelf. Obviously a book of this size cannot and does not claim to be comprehensive. I think that the balance of the various sections is about right and some of the more contentious areas of dermatopathology, such as the melanocytic lesions, are given ample consideration. Any shortfalls in the included material are to some extent compensated by the remarkably up to date references. The photomicrographs, both colour and black and white, are good and the index appears to work pretty well. All in all this book is good value and is yet another worthwhile addition to this series.
